

Leading edge heart and vascular care *leaves dangerous hardening of the arteries behind.*

Changing Medicine

After decades of progressive heart disease, Duane Hagensick faced a risky surgery to repair a potentially lethal abdominal aneurysm. Nationally renowned doctors at University of Iowa Heart and Vascular Center, however, skillfully increased his odds of success through precise heart monitoring and medication. When the time was right, a six-hour procedure successfully replaced the failing aorta with a prosthetic graft.

Changing Lives

Feeling “lucky to be alive,” Duane now lives a renewed life of light exercise, and of course, walks in the park with his wife, Phyllis. And both are relieved that when critical medical decisions needed to be made, they chose the one hospital known for leading edge care.
